

ECLIPS Internal Workshop 2

Frank DiTraglia & Ludovica Gazze

Preliminary Results

Phase I: Recruiting / Study Participation Decision

Clean up this flowchart: turn it into a Frank/Ludovica birds-eye view of Phase I and Phase II. Then “zoom in” on specific parts and fill in details. Could be more like Angela’s flowchart initial boxes. E.g. addresses, letters, randomization, re-balancing, dust kits, feedback

Design

Sampling Design

- ▶ What is our sampling frame? What kinds of exclusion criteria? (removed student residences, hotels, commercial blah blah)
- ▶ What external data sources did we use? (Census, EPCs, Leeds Council Tax, Postal Codes)
- ▶ How / why did we stratify and what did we stratify on? Estimate share eligible (child 1 to 6; how we approximated it)
- ▶ Also stratify by housing age and LSOA (say how many LSOAs)

Map of where we sent letters

- ▶ Map of where we sent letters for both rounds; possibly next to or alongside a plot of the estimated share eligible across LSOAs.

Describe the treatments

- ▶ This slide gives the text and the motivation
- ▶ One treatment is only for old houses
- ▶ Definition of old house

Results

Description of outcomes

- ▶ Define “response” as response within 45 days of sending letter
- ▶ Define “usable” response as: GP, valid other stuff... (check this)
- ▶ (Is there anything else? Maybe; if so add here)

Basic Results

- ▶ How many usable responses did we get? Overall / (stable by round) / by treatment / by age of house
- ▶ This is not a set of regressions (per se) it's just raw shares by cell (treatment / kind of house / histogram or map by LSOA)
- ▶ Could compare against our protocol where we predicted response rates based on similar studies; could talk about the per participant cost of recruiting in this way (need the total letter cost)

More results: heterogeneity etc

- ▶ Frank did a bunch of crazy stuff!
- ▶ Various regressions; can we show them graphically? (Probably yes: use a map)
- ▶ Can we show regressions? (Yes we can!)
- ▶ Index of multiple deprivation is particularly interesting here but it's actually *not* a census characteristic. Should point out where we got it from.

Non-usable results

- ▶ Are there any treatment effects for *clicking on the survey* or *starting the survey* even if you don't finish?
